Once connected to the O.MG's  
access point, open your phone's  
browser and head over to

**192.168.4.1**

**At the bottom of the web UI, select the “*LOAD*” button to choose various demo payloads from the onboard flash.**

**SLOT ONE:** Shows the HID injection capability by opening notepad and printing a brief overview of the device, as well as some examples of various text.

**SLOT TWO:** Further emulates keystrokes by opening/browsing the UC Baseline webpage via a Powershell command and selecting Hardware 101 spec sheet to display.

---

### **Things to know !**

- You'll see the signal fluctuate continuously and even drop to 0. If connectivity is a problem, you can change the AP's channel under the settings menu on the web UI.
- Due to the size of the device and radio, it can be finicky. If a payload doesn't run the first time, click “***RUN***” again until you get the “running payload” dialogue.
- After a payload executes, you may lose connection to the cable's AP. Make sure to reconnect or select “connect automatically” under your phone's wireless settings.
